CONSERVATION

Increase in Native Vegetation Cover in Areas Destined for Restoration and Conservation

The Goals and Indicators Plan – PMI, establishes the parameters to be achieved bimonthly by Sisema, including Goal 5 which deals with the Increase in Native Vegetation Cover Destined for Restoration and Conservation. The established goals and the cumulative result of 2022 and 2023 can be seen in the graph below:

The main actions that contributed in 2022 and 2023 to achieving the goal are: environmental compensations imposed in environmental intervention processes, followed by the implementation of RPPN's and the regularization of the Legal Reserve.

The map on the side demonstrates the IEF's activities in the municipalities, only for the year 2023. It should be noted that the state of Minas Gerais has an area of 586,528 km², distributed in 853 municipalities and more than 1,000,000 rural properties, divided in 3 Biomes (Atlantic Forest, Cerrado and Caatinga).
